

# Installing and Upgrading TSM 6.8

This guide will take you through the installation of TSM 6.8 or upgrading TSM 6.7 or below to TSM 6.8.

If you are installing TSM on Windows 2000, please read the document titled 'TSM - Windows 2000'.

# Existing TSM users, please read the following warnings before continuing

This is a major upgrade of TSM. As a precaution, please take a backup of your TSM data, including reports and labels, before continuing. It is your responsibility to make sure that this backup is successful. Please keep the backup in a secure location.

Depending on the size of your data files, and the speed of your processor, this update may take up to an hour or more to complete. It is recommended you do this at a time which will not affect your business, and that someone stays with the upgrade until it is completed successfully.

Your current registration details will not carry forward to TSM 6.8. When the update is completed you will need to contact Proware's Sydney Office and register your TSM BEFORE you will be able to use it. It is recommended that the person doing the upgrade be the only person to launch TSM until it has been re-registered. Please make allowances for this in the timing for installing the upgrade to ensure our registration staff are available when you expect to require your new registration details.

Although we have tried to maintain backward compatibility with the older reporting system, some reports that were customised for the old report system in TSM 6.5 and prior may fail to work in TSM 6.8 and might need to be recustomised for TSM 6.8. Please read the 'TSM Reports' section of this document for more information. We STRONGLY recommend that you no longer use those old reports designed for a previous version of TSM.

Support for the TSM 6.8 Upgrade process will only be provided to customers with a valid TSM Support Agreement and current TSM Maintenance Agreement.. The TSM Maintenance Agreement does not cover support issues. Support can be purchased as an Annual pack, 5 Incident pack, or Pay As You Go. Pricing of support options is available from the TSM support department on +61 2 8002 2311

We recommend you read and understand this entire document before beginning the upgrade installation.

#### **Files Required**

For new TSM Installations, you will require the Full TSM Installation program:

• TSM68DL.EXE

For the initial TSM 6.8 Upgrade, you will require:

• TSM68UP.EXE

Subsequent upgrades of TSM will be performed via the Upgrade TSM Utility menu option via your internet connection.

You will also require the TSM 6.8 Network / Workstation Installation program:

• TSPRONET.EXE

The workstation Installation program files are available from <u>www.theservicemanager.com</u>, under the 'Services' and 'Version Updates' menu options or by clicking this link directly: <u>http://www.theservicemanager.com/verupdates.html</u>. The full TSM Installation program and upgrade program can be obtained directly by contacting TSM or your sales representative or TSM support.

# Installing TSM for the first time

 Obtain a copy of the TSM installation file. This is can be found on the TSM Installation CD provided to new customers. If the Installation CD cannot be found, please contact the TSM Support desk for a temporary link where the file can be downloaded. The file is named 'TSM68DL.EXE'.

Once the file has been found, execute it. You will be greeted with the welcome screen. Click "Next".

 The TSM Licence Agreement will now be displayed. Advise the client to carefully read the Licence Agreement. When they approve of the Agreement, have them select the "I accept the agreement" option and click "Next".

 You will now be asked for the directory to install TSM to. The preferred standard is to create a mapped drive (usually T:\) and to install to a 'TSM' directory under this. Do not install to an IP address. Do not install to the root of a mapped drive.

Once you have selected the correct location, click "Next".

- The next screen will ask you which Start Menu group to add the TSM icons to. You may either click browse and select an existing group, or leave the default and click "Next"
- 5) The next screen will ask whether you would like to create a desktop icon. Tick or untick the box as appropriate and click "Next"

 This screen will review the choices you've made in the previous steps. Once you have confirmed the details, click "Install"

7) The installer will now begin copying files.

Once this is finished, the final screen will be displayed. Click "Finish" to

Revision 1.1 19 Decembe

Setup - The Service Manager 6.6 Full Installation	
Installing Please wait while Setup installs The Service Manager 6.6 Full Installation on your computer.	Ð
Extracting files T:\TSM\tam.dl	
	Cancel

#### close the installer.

You may now run TSM, either by double clicking the desktop icon which was created, or by launching the executable from the directory you chose to install to.

When TSM is run for the first time, it will begin a check and reindex. This will take 2-3 minutes to complete.

As this copy of TSM has not yet been registered, the next time TSM is run, the Test Drive screen will appear.

Test Drive Vé. 8 200 record limit active 2 der Link. 2 der Link. 2 der Link.

Select Option 3 "Start TSM" and contact the TSM accounts department for registration details.

# Using the TSM Download page

- 1) Go to <u>www.theservicemanager.com</u>
- 2) Click on the heading "Services" and then on "Version Updates". Click on the link to continue to the downloads page.
- Scroll to the bottom of the registration page and click "Go to download page"
- 4) Select the file you require and click the download button.
- 5) Some more problematic browsers may display a security warning at this point. Right click on the warning message and select "Download file"
- 6) It is recommended that files are saved in the TSM\Setups directory, so that they can be easily accessed by every machine on the network.

# Installing the Documentation Package

TSM 6.8 uses a new Online documentation Wiki so there is no longer any need to download the documentation package. However, since this is a work in progress, do of the documents in the documentation package may not be available on the Wiki. You may download the previous TSM67HLP.EXE from the TSM website or from the TSM Installation CD.

It is a self extracting archive which should be extracted directly into your TSM directory.

You will need to use Internet explorer to access this file once it is installed.

# **TSM Backups**

Running a TSM Backup copies the TSM data files into a .zip archive. TSM

Backups should be run every night to ensure minimum data loss in the event of a server crash or other problem.

TSM Backups should be explained to new clients and they should be aware of the importance of their backups.

	📉 Backup / Restore		
To run a TSM Backup, open TSM and log in. Now go to	Backup		Restore
Utilities and Backup/Restore.	Enter a destination for ba	ickup file (blank	; for TSMPro directory)
The options should be set to Dated Backups and Include	W:BACKUPSI Backup to which file name		
T:\>cd tsm T:\tsm>tsm.exe backup_		TSM Properties	t Compatibility Security
Reports and Labels and the destination directory should be on another machine, or prefe removable medium, such as a U drive or removable hard drive.		Target type: Target location: Target: Start in: Shortcut <u>k</u> ey: <u>B</u> un:	Application TSM T:\TSM\IEXE backup T:\TSM None Nome
Once the Backup has been set u run a backup by adding the 'bac command line switch when you	kup'	Comment: <u>Find T</u>	Target Change Icon Advanced
This can also be used to create	a desktop		

This can also be used to create a desktop shortcut that will start a backup.

To ensure that backups are not forgotten, use the Windows Task Scheduler

# Reindexing

TSM Data files use an index to keep track of where each piece of data is in the table. Reindexing re-creates these files to ensure their accuracy. Reindexing regularly can provide dramatic improvements to the speed of TSM.

To start a Reindex of TSM data - go to Utilities and select Reindex.

Use the tick boxes to select which tables should be reindexed. Make sure the Fast Text Search option is ticked when reindexing for the first time.

Explanation of the Pack option: When a record is deleted from TSM, it remains in the table with a 'deleted' flag set against it, making it invisible to TSM. When TSM searches for a record, it has to skip over

these records, slowing it down. The "Pack" option removes these deleted records, which reduces the size of the database and increases TSM speed. It also means that deleted records can not be 'resurrected' in the case of an accidental deletion, so it must be used with caution.

You can also start a reindex from the command line by adding the word 'reindex' to the end of the executable, as with the 'backup' command.

# Using the Windows Scheduler to automatically run TSM with Command Line parameters

The Windows Scheduler provides a convenient tool for automating the running of TSM with Command Line parameters.

The following example takes you through the steps to schedule an automatic backup of TSM each evening at 1:00am however you can use the same procedure to schedule any of the TSM Command Line Parameters. The screens might vary slightly for different versions of Windows.

From the Windows Control Panel, select Scheduled Tasks to display the Scheduled Tasks window.

Click the Add Scheduled Task option to start up the Scheduled Task Wizard:

🖴 Scheduled Tasks						
File Edit View Favorites	Tools	Advanced Help				_
🌀 Back 🔹 🌍 🕤 🏂	Se 🔎	arch 😥 Folders 🛄 🔹				
Address 🙆 Scheduled Tasks						💌 🔁 G
		Name 🔺	Schedule	Next Run Time	Last Run Time	Status
Other Places Control Panel My Documents My Network Places	۲	Add Scheduled Task				
Details	۲					
Scheduled Tasks System Folder						
		<				

Press the Browse button and select TSM.EXE from your live TSM directory.

C<u>W</u>eekdays C<u>E</u>very <u>1 </u>days

Start <u>d</u>ate: 28/03/2003 **•**  Enter a descriptive name for the schedule and choose Daily.

Enter the start time, select Every Day and enter the date you want the schedule to commence.

<<u>B</u>ack <u>N</u>ext> Cancel

Enter a windows network user name and password that has rights to run and log in to

TSM. (This is not necessarily the same as the TSM login name and password)

Select the "Open advanced properties for this task when I click Finish" option and press Finish.

TSM Nightly B	ackup	? 🛛
Task Sched	ule Settings	
<b>5</b> C:\W	/INDOWS\Tasks\TSM Nightly B	ackup.job
<u>B</u> un:	c:\tsm\TSM.EXE backup	
		Browse
S <u>t</u> art in:	c:\dev\tsm\tsm60	
<u>C</u> omments:		
R <u>u</u> n as:	NTDOMAIN\david	Set password
<b>I E</b> nabled (s	cheduled task runs at specified ti	me)
	ОК	Cancel <u>Apply</u>

The advanced properties let you adjust various aspects of the scheduled activity. Select the Run command and enter BACKUP on the end like so "c:\tsm\tsm.exe backup" (substitute the actual path to your live TSM system.

**Note:** You can substitute any of the other TSM Command Line Parameters in place of BACKUP to automate that command line option.

Press OK to save your changes.

That is all that is required. From now on, TSM should automatically do a backup at 1:00 am each morning.

### Installing the Workstations

The TSM Workstation install creates a desktop shortcut to TSM, and installs files which are needed locally, such as the TSM PDF printer/viewer. It must be installed on every workstation intended to run TSM, and on the system where TSM was originally installed.

The most common reason reports fail to print is because the Workstation has not been installed.

# The above error messages are displayed when trying to print a report without having run the Workstation Install

The file required is named TSPRONET.EXE and can be downloaded from the TSM website. It is also available on the TSM Installation CD. It is recommended that a /Setups directory is created under the TSM directory, and that a copy of the TSPRONET.EXE is placed here for easy access from any computer on the network.

Before running the file, you must ensure that TSM is not running on the current Windows session. If errors occur during the installation it may be necessary for all users to log out of TSM.

The Installation program is very similar to the Full Install previously covered. As this installer will attempt to register some .DLL files, you may need to log in to the local machine as an administrator.

During the Workstation Install you will be asked for the path where TSM was previously installed. This is to be the same directory specified in the Full Install of TSM. If you are referencing a mapped drive, make sure that the drive has been mapped on the workstation, and that it is pointing to the same directory.

😰 Setup - The Service Manager 6.6 Workstation Installation 💦 🔲 🔀
Select Destination Location Select your working TSM directory
Select the folder where your live TSM program is already installed. If running over a network, select the TSM directory on your file server. Click Next to continue.
To continue, click Next. If you would like to select a different folder, click Browse.
Bjowse
Al least 17.3 MB of free disk space is required.
< <u>Rack</u> Next> Cancel

Once this is complete, a TSM icon should be available on the desktop, and the user will be able to start using TSM.

#### Installing TSM Updates.

Updates to TSM are released as issues are identified and resolved. Once a month TSM clients receive a newsletter identifying any items of interest with the latest TSM updates. Because TSM 6.8 now uses on online update, we no longer issue passwords for the TSM update.

Major updates including new features are released less often, and usually include separate, specific documentation on update procedures.

Before running the update, it is recommended the user do a TSM backup.

All users must be out of TSM before you run the update.

An IISRESET must be performed on any machine running a TSM web application (TSM Remote, TSM Live, TSM Self Service, etc).

TSM Accounting links can not be open during the update.

#### Installing the initial TSM 6.8 update from a prior version of TSM

You should only perform this update if you are coming from a prior version of TSM that does not have the online update facility. The TSM Update installer is very similar to the other Install programs described so far.

You should have received an email from the support department outlining where to find the update and what the password is. At the

🕼 Setup - The Service Manager Update 6.60146
Password This installation is password protected.
Please provide the password, then click Next to continue. Passwords are case-sensitive.

Revision 1.1 19 December

password prompt, you will need to use the password provided to you by the support department. If the client cannot provide this, the TSM Helpdesk will be able to tell you if they are entitled to the update and provide you with the password if necessary.

When prompted for the TSM directory, use the directory used when initially installing TSM. If you do not know the name of this directory, you can right click on the existing TSM icon and view the properties.

Once the Update has finished, run the TSM.exe. It will begin its self test and reindex. This may take some time, depending on the

🖞 Setup - The Service Manager Update 6.60146 🛛 🔲 🗖 🔀				
Select Destination Location Select your working TSM directory				
Select The tolder where your live TSM program is already installed. Ill surving over a network, Change the default directory CVPGG/DAF FLES/TSM to the the TSM directory on your Bit surver. size of the TSM data files. During this time, no other users will be able to open TSM.

When the check and reindex are complete, you may start TSM again. The upgrade is now complete.

### Troubleshooting.

# Error while updating

Error	
<u>.</u>	c:\tsm\TSM.EXE An error occurred while trying to replace the existing file: DeleteFile failed; code 32. The process cannot access the file because it is being used by another process. Click Retry to try again, Ignore to skip this file (not recommended), or Abort to cancel installation.

If you receive an error similar to the above, this means that the file that is displayed in the error message is in use and cannot be overwritten.

Common causes:

- 1) Someone has TSM open.
- 2) Someone has the QuickBooks or MYOB link open.
- 3) You have not run an IISRESET on the computer that is hosting TSM Live, TSM Self Service or TSM Remote.

4) Someone had TSM open when they closed their Remote Desktop/Terminal Service Connection

If you have checked the above, and are still not sure why there is an open TSM file, please do the following.

1) On the **TSM Server**, right click on the 'My Computer' icon and select manage. This will open the Computer Management window.

2) Expand 'Shared Folders' and then 'Open Files'

This will display all the files that are open on the server.

3) Right click on any files that are in the TSM directory and click 'Close Open File'. You can hold shift to select multiple files at once.

U) D; (Program Hies (Golumine (1x52 (1x52, uii				
D:\Program Files\tsm\assig	Close Open File	ME		
D:\Program Files\tsm\assig		ME		
D:\Program Files\tsm\assig	All Tas <u>k</u> s	▶ ME		
D:\Program Files\Tsm\atta		- /IN		
D:\Program Files\tsm\cash	Refresh	ME		
D:\Program Files\tsm\cash	<u>H</u> elp	ro		
D:\Program Files\tsm\cash.	dbr	ME		

If you continue to get this error when you click Retry, click Abort, reboot the TSM server and then re-run the TSM67UP.exe.

Error	
1	c:\tsm\TSM.EXE An error occurred while trying to replace the existing file: DeleteFile failed; code 32. The process cannot access the file because it is being used by another process. Click Retry to try again, Ignore to skip this file (not recommended), or Abort to cancel installation.

If you clicked Ignore when you got this error message, you will have to rerun the TSM68UP.exe

# **TSM Reports**

TSM 6.8 contains many new features, among which is an updated reporting engine.

Although we have tried to convert existing reports to the new engine, some reports that were customised for TSM 6.5 may eventually need to be adjusted for TSM 6.8. We have included the older TSM report engine for compatibility in the short term, but all TSM users will have to switch to the new TSM 6.8 report engine at some point, as the TSM 6.5 report engine will be phased out and not supported over time, and may not work with some of the new TSM reports.

Until you are ready to go through with the switch to the new report engine, you are able to run TSM 6.8 in backwards compatibility mode however we can not guarantee that all reports using the old report engine will work at all.

The new TSM report function is accessible by going to Utilities -> Setup -> General.

et ]	Delault Purchase Tax Code.			0.00		
<u>.</u>	Report System	💿 Old	◯ New			

This will be set to 'Old' by default.

You should try your customised reports with the new engine to determine which will need adjusting. In general, all detailed reports, such as Job Cards and Invoices will need to be re-customised from scratch, while most summary reports will only require minor tweaking.

# **Field Overflow**

If you see stars appearing in a report, as below, it is because the field is too small to accommodate the value that should be displayed. We will need to expand this field so that it displays the value correctly.

Start	Finish	Hours Billable Hours	Туре	Rate	Total
13:50	15:30	1.66 ********	STANDARD	\$72.73	\$127.28
12:50	13:50	1.00 ********	TR AVEL	\$72.73	\$72.73
08:30	12:35	4.08 ********	STANDARD	\$66.00	\$280.50
08:30	12:30	4.00 ********	STANDARD	\$66.00	\$264.00

Select the report with the error from the list, and click 'Customise'. If your report is not in this list, you can look through the other categories by using the Report Type dropdown menu.

Identify the field that is having the problem. Click on it once to select it.

In this example, it is the Bill field which we will need to make wider.

It may help for you to have a printed out copy of the report with the error to use as a reference when finding the correct field. We now need to check which side of the field the text is aligned to. To do this, make sure you have the field selected and click on Format -> Text Alignment

If the text is aligned to the left, we will need to extend the field to the right, and vice versa.

Kill type RATE total	<u>LAB</u> )

To extend the field, click and hold on one of the black boxes on the left or right edge of the field (depending on which side you are moving). Now drag the cursor to elongate the field.

You may need to adjust this and other fields on this report so that everything fits nicely. You can do this by clicking on the field you want to move and then using the arrow keys on your keyboard to move it.

You can hold the Shift key while you click on fields to select more than one at once.

You may need to print the report to screen a few times and make minor adjustments to each field until the alignment is just right.

#### **Further Assistance**

If you are not able to resolve any errors yourself, please contact your TSM distributor or TSM directly and they can quote you for the work required.

As previously mentioned, all reports that were customised in TSM 6.5 using the old report engine will need to be checked for compatibility with TSM 6.8

#### Instructions on running TSM in Windows Vista

Current versions of TSM are fully compatible with Windows Vista, however due to the new security model it uses, some additional steps are required when installing.

It is possible that the TSM Network/Workstation installer or TSM full installer will fail to register some of the TSM files with Windows due to Vista's security restrictions.

If you experience errors upon starting TSM relating to the LISTBAR or OCX files, there are two possible solutions.

Solution A

- 1) Right-click on the TSM shortcut icon on your desktop and select properties.
- 2) Click on the button "Advanced" located on the Shortcut tab.
- 3) Tick the option "Run as Administrator."
- 4) Re-start TSM

#### Solution B

Start the Command Prompt in admin mode;

- 1) In the start menu go to Programs and Applications and right-click on it in the command prompt button
- 2) Select "Run in admin mode"

Register the files manually;

- 3) Browse to the TSM directory and
- 4) Run regsvr32 \*.ocx and regsvr32 tsm.dll
- 5) Re-start TSM

# How to run TSM on Windows 2000.

- 1) Use Windows Update to bring the system up to date with all security patches.
- 2) Use Microsoft Update to install Internet Explorer 6 SP1.
- 3) Go to Control Panel and open 'System'.

4) Go to the Advanced tab and select Environmental Variables.

System Properties					
General Network Identification Hardware User Profiles Advanced					
Performance Performance options control how applications use memory, which affects the speed of your computer.					
Performance Options					
Environment Variables					
Environment variables tell your computer where to find certain types of information.					
Environment Variables					
Startup and Recovery					
Startup and recovery options tell your computer how to start and what to do if an error causes your computer to stop.					
Startup and Recovery					
OK Cancel Apply					

5) Select the 'Temp' System variable and click Edit

Env	invironment Variables
